

Exercise

Overview

- SDG 17 is about strengthening and revitalising global partnerships among governments, the private sector and civil society.

Core Pillars

- **Finance:** Mobilizing domestic and international resources, increasing foreign direct investment for developing nations, and ensuring debt sustainability.
- **Technology:** The promotion of international cooperation science and innovation and the transfer of environmentally friendly technologies.
- **Capacity Building:** Strengthening national capabilities for implementing effective, data-driven sustainable policies through localized training and knowledge sharing.

Relevance to sustainability Engineering

SDG 17 provides the collaborative blueprint required to move innovations from the lab bench to global implementation:

- **Green Technology Transfer:** Engineers rely on cross-border partnerships to scale renewable energy grids, waste-to-energy systems, and efficient water infrastructure in regions that need them most.
- **Interdisciplinary Integration:** Complex sustainability challenges require engineers to collaborate closely with data scientists, environmental economists, and municipal policymakers to ensure technical designs align with socio-economic realities.
- **Global Standardization:** Establishing universal life-cycle assessment (LCA) metrics,
